DAY 2

Table of contents

- Web 101
- Vanilla Server

WEB 101

Http Request

Request

```
POST / HTTP/1.1
```

← Start line

```
Host: developer.mozilla.org
```

```
User-Agent: curl/8.6.0
```

```
Accept: */*
```

← Headers

```
Content-Type: application/json
```

```
Content-Length: 345
```

← Empty line

```
{
```

```
"data": "ABC123"
```

← Body

```
}
```

Http Headers

- HTTP headers are key-value pairs sent in both request and response messages to provide additional information about the request or response.

Authorization → Contains the credentials to authenticate a user-agent with a server.

Expires → The date/time after which the response is considered stale

Accept → Informs the server about the types of data that can be sent back.

Accept-Encoding → The encoding algorithm, usually a compression algorithm, that can be used on the resource sent back.

Cookie → Contains stored HTTP cookies previously sent by the server with the Set-Cookie header.

Access-Control-Allow-Origin → Indicates whether the response can be shared.

Http Methods

- Defines the action to be performed on a resource.

GET → retrieves data from the server

POST → send data to the server

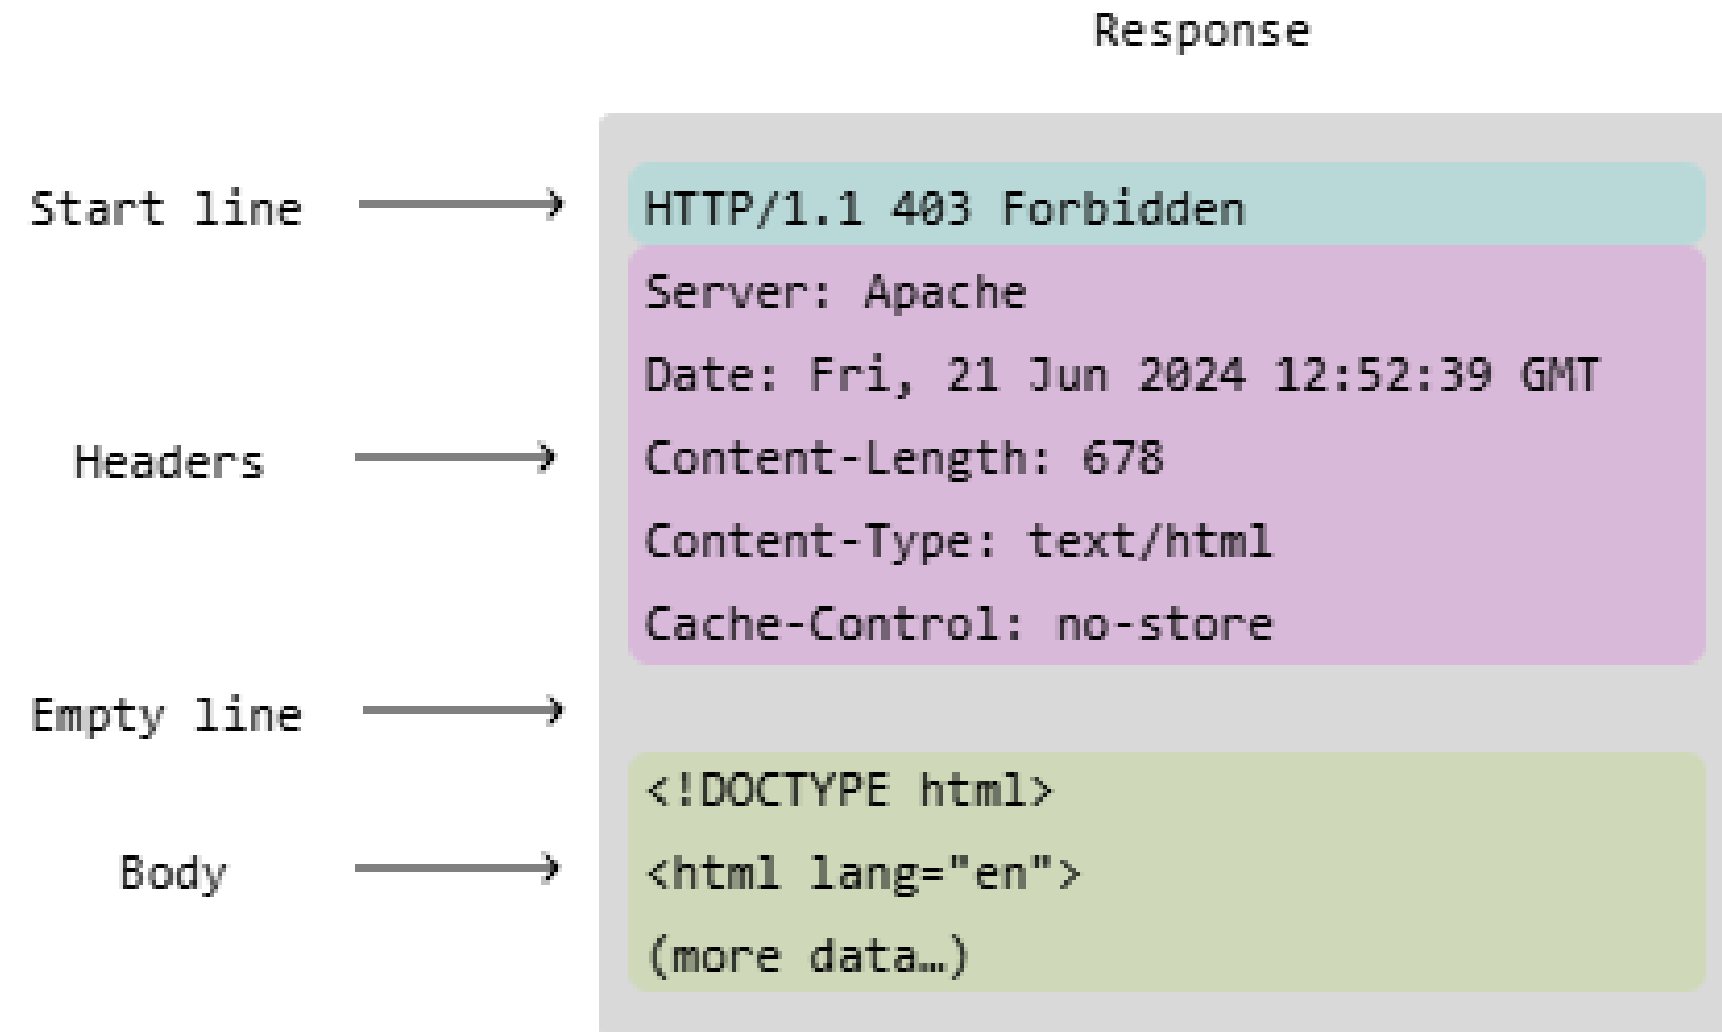

PUT → replaces data on server (**idempotent**)

PATCH → updates data on the server

DELETE → removes data from the server

More info: <https://developer.mozilla.org/en-US/docs/Web/HTTP/Reference/Methods>

Http Response

Http Status Codes

1xx	Informational	
2xx	Success	
3xx	Redirection	
4xx	Client Error	
5xx	Server Error
